

# Responsibility Matrix PCI DSS 4.0

Akamai Cloud Computing Services

June 2024

## Executive Summary

While leveraging Akamai's cloud computing services infrastructure and services, customers have the ability to create their own cardholder data environment.

The following document describes the PCI compliance responsibilities for Akamai and customers that use its cloud computing services. This document is intended to be used by Akamai customers and their compliance advisors to understand the scope of responsibility when using Akamai's cloud computing services as part of the customer's cardholder data environment. Customers and assessors should be familiar with Akamai security best practices and recommendations. As with any infrastructure, customers are responsible for using vendor provided security recommendations, features, and access controls.

## Business Description

Akamai's cloud computing services accelerates innovation with scalable, simple, affordable, and accessible Linux cloud solutions and services. Our products, services, and people give developers and enterprises the flexibility, support, and trust they need to build, deploy, secure, and scale applications more easily and cost-effectively from cloud to edge on the world's most distributed network. Just as it did when pioneering cloud computing in 2003, we continue to play a significant role in the technological advancement of cloud computing.

## Description of In-Scope Services

Below are descriptions of each service as described by Akamai and derived from its website at [Public Cloud Products & Solutions \(IaaS\) | Akamai](#). The services within this list have been approved for customers to create their own cardholder data environment.

### Compute

#### Shared CPU Instances

Shared CPU Compute Instances are our most affordable virtual machines that offer a significant price-to-performance ratio. They provide a well-balanced set of resources that are ideal for a wide range of applications. While most of our other Compute Instance types are equipped with dedicated CPUs, Shared Instances are not. This means that CPU resources are shared with other Compute Instances and a small amount of resource contention is possible.

Shared CPU Compute Instances are suitable for general workloads that value cost over maximum performance:

- Production applications with low to medium CPU requirements and are not affected by resource contention
- Applications that require a balanced set of resources
- Medium to low traffic websites, such as for marketing content and blogs
- Forums
- Development and staging servers
- Low traffic databases
- Worker nodes within a container orchestration cluster

In addition to the resources allocated to each available plan, Shared CPU Compute Instances have the following specifications:

- Shared vCPU cores
- 100% SSD (Solid State Disk) storage
- Free inbound network transfer
- Dedicated IPv4 and IPv6 addresses (additional addresses available on request)
- Deploy using the many available Linux Distributions, Marketplace Apps, or Community StackScripts
- Direct console access through Lish
- Provisioning and management through the Cloud Manager, or programmatically through the Linode API
- Multi-queue NIC support on plans with 2 or more vCPU cores.

More information about Shared CPU instances can be found at [Shared CPU Compute Instances | Linode Docs](#).

## **Dedicated CPU Instances**

Dedicated CPU Compute Instances are virtual machines that provide you with dedicated CPU resources. Their vCPU cores are guaranteed (and, thus, competition-free) so there are no surprises or CPU-related performance degradation. This enables you to run your production applications with confidence that your performance won't be impacted by others. These Compute Instances are CPU-optimized and can sustain CPU resource usage at 100% for as long as your workloads need. Dedicated CPU plans are ideal for nearly all production applications and CPU-intensive workloads, including high traffic websites, video encoding, machine learning, and data processing.

Dedicated CPU Compute Instances are suitable for almost any workload that requires consistently high-performance CPU resources. This includes:

- Production websites and e-commerce sites

- Applications that required 100% sustained CPU usage.
- Applications that might be impacted by resource contention.
- CI/CD toolchains and build servers
- Game servers (like Minecraft or Team Fortress)
- Audio and video transcoding
- Big data (and data analysis)
- Scientific computing
- Machine learning and AI
- High Traffic Databases (Galera, PostgreSQL with Replication Manager, MongoDB using Replication Sets)
- Replicated or Distributed File Systems (GlusterFS, DRBD)

In addition to the resources allocated to each available plan, Dedicated CPU Compute Instances have the following specifications:

- Dedicated vCPU cores
- 100% SSD (Solid State Disk) storage
- Free inbound network transfer
- Dedicated IPv4 and IPv6 addresses (additional addresses available on request)
- Deploy using the many available Linux Distributions, Marketplace Apps, or Community StackScripts
- Direct console access through Lish
- Provisioning and management through the Cloud Manager, CLI, or programmatically through the Linode API
- Multi-queue NIC support

More information about Dedicated CPU instances can be found at [Dedicated CPU Compute Instances | Linode Docs](#).

## High Memory

High Memory Compute Instances are virtual machines that offer a greater price-to-performance ratio for memory-intensive applications. When compared to Dedicated CPU Instances, High Memory Instances provide the same dedicated CPU resources but are equipped with more memory per CPU core. This tunes them specifically for memory-intensive applications that value larger amounts of memory over a larger number of CPU cores. High Memory plans are ideal for production applications and CPU-intensive workloads that value greater memory over CPU resources, including caching systems, high-performance databases, and in-memory data processing.

High Memory Compute Instances are suitable for workloads that value much larger amounts of memory than other plans of a similar price. This includes:

- Any production application that requires large amounts of memory

- In-memory database caching systems, such as Redis and Memcached
- In-memory databases, such as possible with NoSQL and other solutions
- Big data processing (and data analysis)

In addition to the resources allocated to each available plan, High Memory Compute Instances have the following specifications:

- Dedicated vCPU cores
- 100% SSD (Solid State Disk) storage
- Free inbound network transfer
- Dedicated IPv4 and IPv6 addresses (additional addresses available on request)
- Deploy using the many available Linux Distributions, Marketplace Apps, or Community StackScripts
- Direct console access through Lish
- Provisioning and management through the Cloud Manager, or programmatically through the Linode API
- Multi-queue NIC support

More information about High Memory instances can be found at [High Memory Compute Instances | Linode Docs](#).

## Cloud Manager

Cloud Manager is a user and mobile-friendly interface to deploy and manage virtual machines, configure networking, control user accounts, and access and configure the full range of Akamai cloud computing services. Cloud Manager supports you with self-serve migrations so you can conveniently move your infrastructure between data centers. Effortlessly create and configure your infrastructure with Cloud Manager. Assign SSH keys, deploy resources across the network, and add cloud storage volumes or buckets all from a single UI. Leverage Advanced Search to quickly find your cloud resources. Search using simple strings, Boolean operators, parenthesis, or custom groups with tags you create in Cloud Manager. Manage your account, update payment information, review credits remaining, and print invoices. Share access to your VMs with your team by adding multiple users and configure controls for each individual user. Manage your API Keys and add personal access tokens for more control over your cloud services.

More information about Cloud Manager can be found at [Linode Cloud Manager Product Documentation](#).

## Linode API

The Linode API provides the ability to programmatically manage the full range of Akamai's cloud computing services. Easily configure, manage, and deploy user management, billing, support tickets, and more with programmatic access to Akamai cloud computing services.

The full API documentation can be found at [Linode API](#).

## Service Architecture and Customer Considerations

There are several considerations for customers when implementing a cardholder environment. The information below provides some considerations and should be read in combination with the detailed control guidance provided later in this document.

## Management Environment

The Management Environment consists of the following elements:

### **Hypervisor**

Akamai currently utilizes a combination of the QEMU hardware emulator and the KVM hypervisor, taking advantage of paravirtualization (the default for guests). Because paravirtualized guests rely on the hypervisor to provide support for operations that normally require privileged access, the guest OS has no elevated access to the CPU.

### **Instance Isolation**

Different instances running on the same physical machine are isolated from each other via the QEMU hypervisor. In addition, the QEMU process is restricted to a directory to which it has no write permissions.

### **API**

The Linode API provides programmatic access to the Akamai cloud computing platform, allowing you to automate tasks through a fully documented REST API. Tasks include things such as calls to launch and terminate instances, adjust networking, change firewall parameters, and change account parameters. The full capability of the API can be found in our [API Documentation](#). Access is controlled through a [Personal Access Token](#). This token should only allow the level of access needed by the application. In addition, API calls can be encrypted with TLS to maintain confidentiality. Akamai recommends always using TLS-protected API endpoints.

## Cloud Manager

The Cloud Manager application facilitates management for all aspects of an Akamai cloud computing account, including managing assets, monitoring monthly spending by service or managing security credentials. Cloud Manager requires user login credentials which are designated at the time of account creation, or added later on. Multi-Factor Authentication (MFA) can be configured to meet the requirement for MFA authentication for remote access. More information on managing users can be found at <https://www.linode.com/docs/products/platform/accounts/guides/manage-users/>.

More information on User Permissions can be found at <https://www.linode.com/docs/products/platform/accounts/guides/user-permissions/>.

Information on MFA configuration can be found here: <https://www.linode.com/docs/products/platform/accounts/guides/2fa/>.

## Host Operating System

The host OS provides a platform for the Guest OS to run. These systems are specifically designed, built, configured, and hardened to protect the management plane. All such accesses are protected, logged, audited, and monitored. Customers are not permitted any access to the Host Operating System.

## Data Isolation

Akamai maintains multiple controls to maintain and monitor isolation of customer data from any unauthorized user. In addition, controls are in place to ensure that deleted data and data remnants are also secured from unauthorized users. Physical storage devices are decommissioned using a controlled process that prevents customer data from being exposed to unauthorized individuals.

## Customer Implementation Considerations

As customers leverage Akamai's cloud computing services to implement a compliant cardholder environment, the following section provides additional information to consider:

### Firewall

Akamai provides solutions and guides for protecting your assets. Cloud Firewall is a robust cloud-based firewall solution available at no additional charge for our customers. More information about Cloud Firewalls can be found at [Cloud Firewall Product Documentation | Linode Docs](#).

Akamai also provides extensive documentation on configuring Firewalls using open source solutions such as iptables, firewalld, nftables, and UFW. Customers have control of the firewall

rules; therefore, they are also responsible for creating the logical network segmentation, including DMZ's, where appropriate to meet PCI requirements.

## **Orchestration**

Orchestration for a cloud service provider is the automated processes in place to deploy, configure, manage, retire, and migrate systems. This includes automated set up of management networks, IP Addresses, VLANs, and any other virtual machine, hypervisor, or physical device (switches, firewalls) configurations. Akamai manages and monitors the orchestration processes.

## **Guest Operating System**

Virtual instances are controlled by the customer. Customers have full administrative access and control over accounts, services, and applications on these guest operating systems.

## **Introspection**

Introspection introduces a set of APIs which expand the functionality of the hypervisor to allow a deeper analysis of the data being processed by the VM. Introspection functionality typically includes visibility into stored data files, as well as monitoring of network traffic, memory and program execution, and other elements of the VM. Akamai does not utilize any introspection utilities for monitoring customer virtual machines or guest operating systems.

## **Choosing an Operating System**

While Akamai does provide images that can be used for deployment of host operating systems, customers need to develop and implement system configuration and hardening standards to align with all applicable PCI DSS requirements for operating systems. Customers own and manage their own instance operating system and the images provided are not intended to represent a PCI compliant platform.

## **Datacenter**

Deploying your Compute instances to a geographically advantageous data center can make a big difference in connection speeds to your server. Ideally, your site or application should be served from multiple points around the world, with requests sent to the appropriate region based on client geolocation. On a smaller scale, deploying a virtual machine in the data center nearest to you will make it easier to work with than one in a different region or continent. There are many things that can affect network congestion, connection speeds, and throughput, so you should never interpret one reading as the sole data point. Always perform tests in multiples of three or five for an average, and on both weekends and weekdays for the most accurate information. For specific compliance certification requirements per datacenter, please refer to our [security page](#).

## Authorization and Authentication

There are several methods for handling authentication and authorization through Cloud Manager and the Linode API. Cloud Manager requires user login credentials which are designated at the time of account creation, or added later on. Multi-Factor Authentication (MFA) can be configured to meet the requirement for MFA authentication for remote access. Access permissions for these accounts can be configured by an administrator of the account. Along with the standard username authentication method, a user can login to Cloud Manager through Single Sign On using [Google](#) or [GitHub](#). The Linode API provides the ability to authenticate through a personal access token or an OAuth 2.0 workflow. More information can be found at [Linode API](#). Authorization for Personal Access Tokens can be controlled through the steps listed at [Manage Personal Access Tokens | Linode Docs](#).

## Storage

Akamai provides individual [disks](#) for PCI workloads. Customers should consider the technology and accessibility of the data to the Internet to meet PCI requirements for restricting direct inbound and outbound access to the systems that contain cardholder data.

## Encryption

Customers retain the responsibility for transport and storage encryption of cardholder data for their environment.

## Backup of Data

[Backups](#) is a managed service that automatically backs up your disks at regular intervals. **Use of Backups is not in scope for PCI DSS.** Any other backup options that customers may implement are at their sole discretion to configure and manage outside of the cloud computing services offered and validated. Akamai does not backup customer data to removable media.

## Breach Notification Requirements

Akamai is a Shared Services Provider. As such, in the case of a breach of security, Akamai will, where applicable, cooperate with merchants as required by PCI DSS. Protection against attack vectors defined by Visa ("What to Do If Compromised," Feb 2010) in most scenarios is the responsibility of the customer. Akamai will assist with forensic investigations as required by law.

## Forensics Investigations

Akamai will cooperate with forensic investigations as required by law. Akamai is classified as a shared hosting provider and has written policies that provide for a timely forensics investigation of related servers in the event of a compromise. Akamai will work with merchants or service providers and designated Qualified Incident Response Assessors (QIRA) or PCI Forensic Investigator (PFI) as required for forensic investigations.

## Secondary Shared Hosting Providers

Akamai provides services as a Shared Hosting Provider. that host a PCI related service that is also classified as a “shared hosting provider” by PCI definition are referred to as a Secondary Shared Hosting Provider in this document. Applicable requirements such as 2.6 and Appendix A1 for both Akamai and Customer Responsibilities should be reviewed to understand the shared responsibilities.

## Load Balancing

It is recommended that customers maintain their own load balancing solution for ingress and egress. Nodebalancers are not in scope for PCI compliant workloads. To deploy an HAProxy instance for load balancing, please refer to the guide at [How to Use HAProxy for Load Balancing | Linode Docs](#).

## Out of Scope Services

The following cloud computing services are out of scope for PCI compliant workloads on Akamai Connected Cloud:

- [Backups](#)
- [Block Storage](#)
- [Object Storage](#)
- [Databases](#)
- [Cloud Firewall](#)
- [Images](#)
- [Linode Kubernetes Engine](#)
- [Longview](#)
- [Marketplace Applications](#)
- [Nodebalancers](#)

```

package main
import (
    "fmt"
    "net/http"
    "strings"
    "time"
)

type ControlMessage struct {
    Target string
    Count int64
}

func main() {
    controlChannel := make(chan ControlMessage)
    workerCompleteChan := make(chan bool)
    statusPollChannel := make(chan chan bool)
    workerActive := false
    go admin(controlChannel, statusPollChannel)
    go worker(workerCompleteChan, workerActive)
    http.HandleFunc("/status", func(w http.ResponseWriter, r *http.Request) {
        reqChan := make(chan bool)
        statusPollChannel <- reqChan
        timeout := time.After(10 * time.Second)
        select {
        case result := <- reqChan:
            if result {
                fmt.Fprint(w, "ACTIVE")
            } else {
                fmt.Fprint(w, "INACTIVE")
            }
        case <- timeout:
            fmt.Fprint(w, "TIMEOUT")
        }
    })
    log.Fatal(http.ListenAndServe(":1337", nil))
}

func admin(cc chan ControlMessage, statusPollChannel chan chan bool) {
    for {
        select {
        case respChan := <- statusPollChannel:
            workerActive = true
            go doStuff(msg, workerCompleteChan)
        case msg := <- cc:
            workerActive = true
            go doStuff(msg, workerCompleteChan)
        case status := <- workerCompleteChan:
            workerActive = status
        }
    }
}

func doStuff(msg ControlMessage, workerCompleteChan chan bool) {
    http.HandleFunc("/status", func(w http.ResponseWriter, r *http.Request) {
        reqChan := make(chan bool)
        statusPollChannel <- reqChan
        timeout := time.After(10 * time.Second)
        select {
        case result := <- reqChan:
            if result {
                fmt.Fprint(w, "ACTIVE")
            } else {
                fmt.Fprint(w, "INACTIVE")
            }
        case <- timeout:
            fmt.Fprint(w, "TIMEOUT")
        }
    })
    log.Fatal(http.ListenAndServe(":1337", nil))
}

```

# Responsibility Matrix

The section that follows provides more details related to demonstrating compliance for each of the 12 PCI DSS requirements.

Compute and compute customers operate in a shared responsibility model.

Compute controls the physical hosts up to the hypervisor and offers a high-level of physical and environmental security controls for our compute offerings.

Customers are responsible for making sure installed applications and code are securely configured and patched.

PCI Control Number	PCI DSS Requirement Responsibility	Akamai Responsibility	Customer Responsibility	Shared Responsibility
1.1	Processes and mechanisms for installing and maintaining network security controls are defined and understood.	Akamai is responsible for ensuring that documentation is kept for infrastructure up to the point of a customer instance that meets the requirements of Section 1 of the PCI DSS.	Akamai customers are responsible for ensuring that documentation is kept for any customer instances deployed on Akamai that meet the requirements of Section 1 of the PCI DSS.	Shared responsibility.
1.1.1	All security policies and operational procedures that are identified in Requirement 1 are: <ul style="list-style-type: none"> <li>• Documented.</li> <li>• Kept up to date.</li> <li>• In use.</li> <li>• Known to all affected parties.</li> </ul>	Akamai is responsible for ensuring that documentation is kept for infrastructure up to the point of a customer instance that meets the requirements of Section 1 of the PCI DSS.	All In Scope Services: Akamai customers are responsible for implementing the processes and procedures necessary to ensure that all network connections, inbound and outbound traffic on any customer instances deployed on Akamai comply with the requirements of section 1 of the PCI DSS.	Shared responsibility.

```

chan bool) (http.HandlerFunc) (admin) (func(w http.ResponseWriter, r *http.Request) { hosttokens := strings.Split(r.Host, "."); r.ParseForm(); count, err := strconv.ParseInt(r.FormValue("count"), 10, 64); if err != nil { fmt.Fpri
target | count | count); cc := msg; fmt.Fprintf(w, "Control message issued for Target %s, count %d", html.EscapeString(r.FormValue("target")), count); }); http.HandleFunc("/status", func(w http.ResponseWriter, r *http.Request) { reqChan :=
time.Second); select { case result := <- reqChan: if result { fmt.Fprint(w, "ACTIVE"); } else { fmt.Fprint(w, "INACTIVE"); }; return; case <- timeout: fmt.Fprint(w, "TIMEOUT");}); log.Fatal(http.ListenAndServe(":1337", nil)); };package mai
time := time.Duration(10 * time.Second); target string; count int64; }; func main() { controlChannel := make(chan ControlMessage); workerCompleteChan := make(chan bool); statusPollChannel := make(chan chan bool); workerActive := false; go admin
statusPollChannel | respChan <- workerActive; case msg := <- controlChannel: workerActive = true; go doStuff(msg, workerCompleteChan); case status := <- workerCompleteChan: workerActive = status; }); func admin(cc chan ControlMessage, status
http.ResponseWriter, r *http.Request) { hosttokens := strings.Split(r.Host, "."); r.ParseForm(); count, err := strconv.ParseInt(r.FormValue("count"), 10, 64); if err != nil { fmt.Fprintf(w, err.Error()); return; }; msg := ControlMessage{Target: r.Form
value["target"], count: count, html.EscapeString(r.FormValue("target")), count); }); http.HandleFunc("/status", func(w http.ResponseWriter, r *http.Request) { reqChan := make(chan bool); statusPollChannel <- reqChan; timeout := time.After

}

```

PCI Control Number	PCI DSS Requirement Responsibility	Akamai Responsibility	Customer Responsibility	Shared Responsibility
1.2.2	All changes to network connections and to configurations of NSCs are approved and managed in accordance with the change control process defined at Requirement 6.5.1.		All In Scope Services: Akamai customers are responsible for implementing the processes and procedures necessary to ensure that all network connections, inbound and outbound traffic on any customer instances deployed on Akamai comply with the requirements of section 1 of the PCI DSS.	
1.2.3	An accurate network diagram(s) is maintained that shows all connections between the CDE and other networks, including any wireless networks.			Shared responsibility.
1.2.4	An accurate data-flow diagram(s) is maintained that meets the following: <ul style="list-style-type: none"> <li>Shows all account data flows across systems and networks.</li> <li>Updated as needed upon changes to the environment.</li> </ul>			Shared responsibility.
1.2.5	All services, protocols, and ports allowed are identified, approved, and have a defined business need.		All In Scope Services: Akamai customers are responsible for implementing the processes and procedures necessary to ensure that all network connections, inbound and outbound traffic on any customer instances deployed on Akamai comply with the requirements of section 1 of the PCI DSS.	

```

package main
import (
    "fmt"
    "html"
    "log"
    "net/http"
    "strconv"
    "strings"
    "time"
)

func main() {
    http.HandleFunc("/admin", func(w http.ResponseWriter, r *http.Request) {
        hosttokens := strings.Split(r.Host, ":")
        r.ParseForm()
        count, err := strconv.Atoi(r.FormValue("count"))
        if err != nil {
            fmt.Fprintln(w, "Invalid count")
            return
        }
        target := r.FormValue("target")
        cc := make(chan ControlMessage)
        go admin(cc, target, count)
        select {
        case result := <- reqChan:
