

Responsibility Matrix PCI DSS 4.0

Akamai Content Delivery & Security Services

June 2024

Purpose

Akamai provides below a detailed matrix of PCI DSS requirements, including the description of whether responsibility for each individual control lies with Akamai, our customers, or whether responsibility is shared between both parties.

While leveraging Akamai's cloud computing services infrastructure and services, customers have the ability to create their own cardholder data environment.

Overview

The PCI DSS responsibility matrix is intended for use by Akamai customers and their Qualified Security Assessors (QSAs) for use in audits for PCI compliance. The responsibility matrix describes, in accordance with Requirement 12.8.5 and other requirements, the actions an Akamai customer must take to maintain its own PCI compliance when cardholder data (CHD) and other sensitive data is passing through or stored on Akamai's systems.

PCI DSS and Akamai Services

Akamai's services that may be used in a PCI DSS compliant manner include the following:

- Secure CDN with Enhanced TLS (the "Secure CDN");
- Content Delivery products such as Ion, Dynamic Site Accelerator, API Acceleration, and Adaptive Media Delivery, when running on the Secure CDN;
- EdgeWorkers, when running on the Secure CDN;
- mPulse digital performance management services;
- App and API security products such as App & API Protector (including the Malware Protection add-on), Account Protector, Kona Site Defender, API Gateway, Cloudlets, and Bot Manager (Standard and Premier), when running on the Secure CDN;
- API Security;
- Client-Side Protection & Compliance;
- Audience Hijacking Protector;
- Secure Internet Access Enterprise (f/k/a Enterprise Threat Protector);
- Akamai MFA;

- Akamai Guardicore Segmentation; and
- The following cloud computing solutions: Dedicated CPU, Shared CPU, and High Memory.

Secure CDN with Enhanced TLS

Akamai's Secure CDN is the core component of its PCI compliant content delivery services. The servers in this network are physically secured against intrusion while being widely distributed around the globe to ensure availability and maximize origin offload. The Secure CDN also provides customers with custom TLS certificates with the flexibility to configure them to satisfy various security and business requirements. The Secure CDN is not typically sold as an independent service but is instead a feature included with most of Akamai's web performance and cloud security products, as described below.

Content Delivery Solutions

Akamai's content delivery solutions, including Ion and such legacy CDN solutions as Terra Alta or Dynamic Site Delivery, typically have the option of having their content delivered securely, in which case that content is delivered via the Secure CDN, and may be used in a PCI DSS compliant manner. Additional products, such as mPulse digital performance management, Cloudlets, and dynamic content delivery options such as adaptive image compression and pre-fetching options, have all been designed to work on Akamai's Secure CDN servers, and may be configured to be fully compliant with PCI DSS.

Edge Computing Solutions

The Akamai EdgeWorkers solution, which enables customers (developers) to create their own services using JavaScript and deploy them across our Secure CDN, is included in Akamai's PCI DSS assessment and may be used in a manner fully-compliant with PCI DSS.

The Akamai EdgeKV distributed key value store is not PCI DSS compliant, however. Please see "Non-Compliant Services" below for more information.

App and API Security Solutions

As with the above content delivery solutions, Akamai's App & API Protector (including the Malware Protection add-on), Kona Site Defender, Account Protector, and Bot Manager application as well as API security products may be configured to operate over the Secure CDN in a PCI DSS compliant manner.

In addition, the web application firewall (WAF) components of App & API Protector, Kona Site Defender, and Web Application Protector may be used by customers to help satisfy their obligations under Requirements 6.4.1 and 6.4.2 of PCI DSS 4.0.0, all of which encourage the use of a WAF, provided that the WAF is configured appropriately in the customers' environment in a manner that their PCI DSS qualified security assessors agree is appropriate under the circumstances.

Bot Manager provides advanced bot detections designed to detect and mitigate the most sophisticated bots, like those typically seen in use cases such as credential abuse, inventory hoarding, gift card balance checking, and other forms of web fraud. Bot Manager's unmatched detections and mitigation capabilities allow automated operations to run more effectively and safely.

Account Protector is designed to prevent account takeover and human fraudulent activity by detecting during the authentication process whether a human user is the legitimate account owner. It does this by generating risk and trust signals to calculate the likelihood of a malicious request, self-tuning as the number of logins increase for the same set of credentials.

API Security protects all APIs, alerts teams to API vulnerabilities, analyzes runtime API interactions for abnormal, suspicious, and malicious behavior, and enables real-time threat response and vulnerability remediation.

Client-Side Protection & Compliance (formerly known as Page Integrity Manager) is a behavioral detection technology for web apps that catalogs JavaScript resources and identifies suspicious and malicious script behaviors. It then notifies security teams with actionable insight, empowering them to rapidly understand, and act on the threats. Client-Side Protection & Compliance is itself PCI DSS compliant and it may also be used by customers to help satisfy their obligations under Requirements 6.4.3 and 11.6.1 of PCI DSS 4.0.0, including managing script inventory, ensuring authorization and integrity of scripts in web applications, and the detection of and response to unauthorized changes to payment pages, respectively, provided that Client-Side Protection & Compliance is configured appropriately in the customers' environment in a manner that their PCI DSS qualified security assessors agree is appropriate under the circumstances.

Audience Hijacking Protector is a key security product for client-side web application protection against unwanted activity from client side plug-ins, browser extensions, and malware. Detecting and mitigating these types of interactions empowers our customers to protect their user journey, preventing users from being redirected to competing and/or malicious websites, reducing shopping cart abandonment rates, curbing fraudulent affiliate activities, and mitigating additional security and privacy risks. As a result, Audience Hijacking Protector will not only improve end-user experiences, but also improve key customer metrics (e.g., conversions, bounce rate, AOV), all while making the web safer for end-users.

Cloud Computing Solutions

Akamai offers a variety of cloud computing solutions. The following virtual machine hosting services are included in Akamai's current PCI DSS assessment: Dedicated CPU, Shared CPU, and High Memory.

Network and Infrastructure Security Solutions

Secure Internet Access (f/k/a Enterprise Threat Protector) (SIA Enterprise) is Akamai's PCI DSS compliant, cloud-based security solution that enables an organization to defend against advanced threats such as phishing, malware, ransomware, and DNS-based data exfiltration. As part of its Secure Web Gateway offering, SIA lets customers set up a proxy that performs URL

filtering and anti-malware scanning on user traffic. The proxy acts as a man-in-the-middle that intercepts SSH/TLS traffic. A certificate generated in SIA or signed by your organization's Certificate Authority (CA) establishes trust between the client and proxy, and further allows Akamai to create a short-lived, dynamically generated certificate that's used to communicate with the destination server.

SIA Proxy inspects the URL path of requests and checks if a URL is a known threat. If it is a threat, the threat is handled based on the policy action that's assigned in an SIA policy. SIA proxy also performs payload analysis to determine whether websites contain malicious content.

Akamai's Prolexic DDoS mitigation solutions are not included in Akamai's PCI DSS assessment but are designed to have no access to or impact on cardholder data, and are therefore readily available to protect customers and their PCI DSS compliant Internet properties from attacks.

Enterprise Security Solutions

Akamai Guardicore Segmentation (AGS) is a microsegmentation solution designed to limit user access to only applications that are authorized to communicate with each other, significantly reducing the threat surface and risk exposure to the spread of malware.

Akamai's Enterprise Application Access (EAA) provides the infrastructure for customers to operate a "Zero-Trust" model for remotely accessing their corporate IT resources that neither stores nor processes cardholder data and has no ability to access customer application data streams. While EAA is not included in Akamai's PCI DSS assessment, services have been reviewed by a Qualified Security Assessor (QSA) and have been determined to be acceptable to use in customers' cardholder data environments.

Non-Compliant Services

Other Akamai services, such as the Netstorage network for storing large files, the legacy FreeFlow CDN, which is intended for traffic containing less sensitive data, Identity Cloud, EdgeKV, and Standard TLS solutions, are not in scope for Akamai's PCI DSS assessment. Customers must configure their properties to avoid using these services in their cardholder data environments.

```

package main; import ( "fmt"; "html"; "log"; "net/http"; "strconv"; "strings"; "time" );
func admin(cc chan ControlMessage, statusPollChannel chan bool) {
    for {
        select {
        case respChan := <- statusPollChannel:
            workerActive := false;
            go doStuff(cc, statusPollChannel);
        case msg := <- controlChannel:
            workerActive = true;
            go doStuff(msg, workerCompleteChan);
        }
    }
}
func doStuff(msg ControlMessage, workerCompleteChan chan bool) {
    status := "Inactive";
    if msg.Target != "" {
        log.Printf("Request for target %s, count %d", msg.Target, msg.Count);
        http.HandleFunc("/status", func(w http.ResponseWriter, r *http.Request) {
            reqChan := make(chan bool);
            statusPollChannel <- reqChan;
            timeout := time.After(10 * time.Second);
            select {
            case result := <- reqChan:
                if result {
                    fmt.Fprint(w, "ACTIVE");
                } else {
                    fmt.Fprint(w, "INACTIVE");
                }
                return;
            case <- timeout:
                fmt.Fprint(w, "TIMEOUT");
            }
            log.Fatal(http.ListenAndServe(":1337", nil));
        });
    }
}
func doStuff(msg ControlMessage, workerCompleteChan chan bool) {
    status := "Inactive";
    if msg.Target != "" {
        log.Printf("Request for target %s, count %d", msg.Target, msg.Count);
        http.HandleFunc("/status", func(w http.ResponseWriter, r *http.Request) {
            reqChan := make(chan bool);
            statusPollChannel <- reqChan;
            timeout := time.After(10 * time.Second);
            select {
            case result := <- reqChan:
                if result {
                    fmt.Fprint(w, "ACTIVE");
                } else {
                    fmt.Fprint(w, "INACTIVE");
                }
                return;
            case <- timeout:
                fmt.Fprint(w, "TIMEOUT");
            }
            log.Fatal(http.ListenAndServe(":1337", nil));
        });
    }
}

```

Responsibility Matrix

Requirement	Requirement Text	Responsibility			
		Not Applicable	Akamai	Customer	Joint
1.1	Processes and mechanisms for installing and maintaining network security controls are defined and understood.		Responsible		
1.1.1	All security policies and operational procedures that are identified in Requirement 1 are: <ul style="list-style-type: none"> • Documented. • Kept up to date. • In use. • Known to all affected parties. 		Responsible		
1.1.2	Roles and responsibilities for performing activities in Requirement 1 are documented, assigned, and understood.		Responsible		
1.2	Network security controls (NSCs) are configured and maintained.		Responsible		
1.2.1	Configuration standards for NSC rulesets are: <ul style="list-style-type: none"> • Defined. • Implemented. • Maintained. 		Responsible		
1.2.2	All changes to network connections and to configurations of NSCs are approved and managed in accordance with the change control process defined at Requirement 6.5.1.		Responsible		
1.2.3	An accurate network diagram(s) is maintained that shows all connections between the CDE and other networks, including any wireless networks.				Customers' network diagram should include any data flows to Akamai Products.

```

3.5.1	PAN is rendered unreadable anywhere it is stored by using any of the following approaches: <ul style="list-style-type: none"> One-way hashes based on strong cryptography of the entire PAN. Truncation (hashing cannot be used to replace the truncated segment of PAN). – If hashed and truncated versions of the same PAN, or different truncation formats of the same PAN, are present in an environment, additional controls are in place such that the different versions cannot be correlated to reconstruct the original PAN. Index tokens. Strong cryptography with associated key management processes and procedures. 		<p>BMP/APR: The service provider is responsible for ensuring PAN is unreadable everywhere it is stored.</p> <p>Malware Protection: The service provider is responsible for ensuring PAN is unreadable everywhere it is stored.</p>	SCDN: Customer is responsible for ensuring that their configurations for using Akamai services will not cause PAN to be cached or otherwise stored on Akamai machines.	API Security: Akamai in conjunction with customers should configure tokenization for all cardholder data entering the platform from on premise nodes. Customers are responsible for all key management activities associated with the tokenization process. Akamai personnel have no access to the keys which are used to tokenize the data and are not able to decrypt it. API activity data that is sourced from the Akamai CDN are protected with a one-way salted hash. Akamai personnel have no ability to reverse the hashed values to derive the original clear text values. Akamai is responsible for the continued successful operation of the hashing processes originating in the Akamai CDN.
3.5.1.1	Hashes used to render PAN unreadable (per the first bullet of Requirement 3.5.1) are keyed cryptographic hashes of the entire PAN, with associated key-management processes and procedures in accordance with Requirements 3.6 and 3.7.		<p>BMP/APR: The service provider is responsible for ensuring PAN is unreadable everywhere it is stored.</p> <p>Malware Protection: The service provider is responsible for ensuring PAN is unreadable everywhere it is stored.</p>	SCDN: Customer is responsible for ensuring that their configurations for using Akamai services will not cause PAN to be cached or otherwise stored on Akamai machines.

Requirement	Requirement Text	Responsibility			
		Not Applicable	Akamai	Customer	Joint
8.2.1	All users are assigned a unique ID before access to system components or cardholder data is allowed.		Akamai is responsible to provide the capability for customers to manage user and administrative accounts for use with Akamai Services	Customers are responsible for configuration of user and administrative accounts for use with Akamai Services in accordance with PCI DSS Requirement 8.	SCDN: Customer must assign all users a unique user ID before allowing them to access the Akamai Control Center. API Security: Customers are responsible for assigning unique user identifiers within their tenant.
8.2.2	Group, shared, or generic accounts, or other shared authentication credentials are only used when necessary on an exception basis, and are managed as follows: <ul style="list-style-type: none"> Account use is prevented unless needed for an exceptional circumstance. Use is limited to the time needed for the exceptional circumstance. Business justification for use is documented. Use is explicitly approved by management. Individual user identity is confirmed before access to an account is granted. Every action taken is attributable to an individual user. 		Akamai is responsible to provide the capability for customers to manage user and administrative accounts for use with Akamai Services	Customers are responsible for configuration of user and administrative accounts for use with Akamai Services in accordance with PCI DSS Requirement 8.	SCDN: Customers are responsible for not using group, shared, or generic IDs, passwords, or other authentication methods when accessing the Akamai Control Center. API Security: Customers should have processes in place for the management of shared accounts if required.
8.2.3	Additional requirement for service providers only: Service providers with remote access to customer premises use unique authentication factors for each customer premises.	Akamai does not have remote access capabilities to customer environments.	Akamai is responsible to provide the capability for customers to manage user and administrative accounts for use with Akamai Services	Customers are responsible for configuration of user and administrative accounts for use with Akamai Services in accordance with PCI DSS Requirement 8.
