Eyevinn Revolutionized Open Source Deployment

The consultancy powered its innovative open source platform and sustainable revenue-sharing model with Akamai Connected Cloud

Easy deployment

Cost-effective

Global scale

Enabling sustainable video streaming

Since 2013, Eyevinn Technology has specialized in streaming media technology for broadcast, TV, and streaming video. Its deep expertise and open source contributions have solidified Eyevinn's reputation as a trusted independent consultancy. When Eyevinn decided to launch the world's first managed media services based on open source, it chose Akamai as its cloud provider.

Making it easier to get started with open source

As a consultancy that helps clients navigate tech strategy and video development, Eyevinn understands the full potential — and hurdles — of open source. The process from evaluation to deployment can be complex and time-consuming.

To make open source adoption as simple as clicking a button, Eyevinn launched Open Source Cloud. "We built our architecture to be cloud agnostic, powered by open source tools. With Kubernetes as our orchestrator, we have the flexibility to choose the cloud computing provider that suits us best," explained Jonas Birmé, VP R&D for Eyevinn.

Akamai Connected Cloud stands out

As Eyevinn evaluated partners, it sought a provider that could scale with growing global demands while ensuring security and data integrity. After narrowing its options, it chose Akamai Connected Cloud.

"Akamai gave us compute power, network capabilities, Kubernetes as a service, and global reach — all at a competitive price," said Birmé. "Plus, it's a leader in security and privacy."

Deployment was a breeze. "We just logged in, spun up a Kubernetes control panel, and seamlessly integrated our streaming pipelines," Birmé added.

Bringing its vision to life

With its Kubernetes-based platform live, Eyevinn has fully realized the benefits of partnering with Akamai. "Akamai handles all our infrastructure and offers excellent support. And developers on our platform enjoy compute power close to them," said Birmé.

By offering a managed service that simplifies deployment, Eyevinn eliminates the usual setup headaches, allowing developers to focus on integrating open source software into their solutions. "Developers can sign up for free and get started with a click. And they're not locked in — they can move their software off the platform whenever they want," added Birmé.

Eyevinn also drives a sustainable open source model, sharing revenue with developers who build on the platform. "Easier access means more users and valuable feedback for developers, fueling constant improvement. We even auto-detect when developers qualify for a revenue share. All of this adds up to delivering the value we envisioned," concluded Birmé.
